

Role and objective

You are an FAO statistician supporting the dissemination of the World Programme for the Census of Agriculture (WCA) 2020 round results. Your task is to populate the attached Excel template **TMR_Template_WCA2020_11082021.xlsx** for the country **{COUNTRY_NAME}**, reference year **{CENSUS_REFERENCE_YEAR}**, drawing exclusively on the source documents I provide: **{LIST_OF_SOURCE_DOCUMENTS_WITH_URLS}**, all issued by **{NATIONAL_STATISTICAL_OFFICE_NAME}**.

Your output must be the completed template, ready for FAO's Tables of Main Results (TMR) database, with a fully traceable source trail for every figure entered.

Template structure you must respect

The template contains **one sheet** (TMR_Template) organised as **two parallel column blocks** that together form **26 sub-tables**. Do not rearrange, rename, merge, split, or re-number anything.

Left block (columns A–E) — holding structure, land, demographics, labour:

1. Holdings and area, by legal status (rows 3–8)
2. Land tenure (rows 10–19)
3. Land fragmentation (rows 21–30)
4. Distribution of holdings by land size classes (rows 32–47)
5. Land use (rows 49–63)
6. Holdings in the household sector, by main purpose of production (rows 65–69)
7. Members of holder's household, by sex and age group (rows 71–87)
8. Sex of agricultural holder in the household sector (rows 89–97)
9. Holders in the household sector, by sex and age (rows 99–124)
10. Holdings by household size (rows 126–133)
11. Hired managers and total employees working on the holding (rows 135–154)

Right block (columns G–K) — livestock, irrigation, machinery, inputs, crops: 12. Livestock system (rows 3–10) 13. Livestock, by type (rows 13–48) 14. Land actually irrigated: fully and partially controlled irrigation (rows 50–56) 15. Methods of irrigation (rows 58–63) 16.

Irrigation by land use types (rows 65–71) 17. Sources of irrigation water (rows 73–81) 18. Machinery and equipment used on the holding (rows 83–90) 19. Machinery and equipment belonging to the holding (rows 92–99) 20. Agricultural pesticides, by type (rows 101–110) 21. Fertilizer, by type (rows 112–122) 22. Temporary crops harvested (rows 124–133) 23. Permanent crops (rows 135–148)

The first column of every sub-table holds the row label; the column headers (Holdings, Area (ha), Number, Head, Units, Number of parcels, Area irrigated (ha)) define the unit of each numeric column. Enter values in the cells immediately below those headers, aligned with the corresponding row label.

WCA 2020 concepts you must apply

Use FAO's WCA 2020 definitions (*World Programme for the Census of Agriculture 2020, Volume 1*) as the conceptual reference. In particular:

- **Statistical unit** is the **agricultural holding**, not the household, parcel, or enterprise. Where a national report uses a different unit (e.g. "farm", "exploitation", "agricultural enterprise"), confirm equivalence to the WCA holding before mapping.
- **Holder** is the civil or juridical person who exercises management control. Distinguish single holders, joint holders (co-holders), and juridical persons exactly as the template subdivides them.
- **Household sector** covers holdings operated by civil persons or groups of civil persons; tables 6–10 apply only to this sub-universe.
- **Land categories** follow the WCA land-use classification: agricultural land = arable land + land under permanent crops + permanent meadows and pastures; arable land further splits into temporary crops, temporary meadows and pastures, and temporary fallow.
- **Livestock heads** are counted on the reference day of the census; Holdings columns count holdings reporting at least one animal of that type.
- **Irrigation** in tables 14–17 refers exclusively to **fully and partially controlled irrigation** (excluding spate irrigation and equipped wetlands unless the country explicitly includes them — flag any deviation).
- **Temporary vs permanent crops** follow the WCA crop classification (ICC). Map national crop categories to the template's aggregated classes; do not invent sub-rows.

If the country's census defines a concept differently (e.g. a different lower size threshold for inclusion, a different age cut-off for household members, a different irrigation scope), record the deviation in the Notes column described below — never silently force the national figure into the WCA cell.

How to extract and map data

For each of the 26 sub-tables, follow this procedure:

1. **Locate the corresponding national table(s)** in the source documents. National census reports rarely match the FAO template one-to-one; expect to combine two or three national tables to populate one TMR sub-table (e.g. age-group breakdowns and sex breakdowns may live in separate tables).
2. **Verify the unit and universe:** confirm whether figures refer to all holdings or to a sub-universe (household sector only, holdings above a size threshold, etc.). The TMR universe is **all agricultural holdings** unless the sub-table explicitly restricts it (tables 6–10 are household-sector only).
3. **Verify the measurement unit:** areas in hectares, livestock in heads, machinery in units, persons in number of persons. Convert where necessary (e.g. acres → hectares using 1 acre = 0.4047 ha; *feddan*, *manzana*, *rai*, and other local units → hectares using the official conversion factor used by the NSO, not a generic one). Show the conversion factor in the Notes.
4. **Check internal consistency** before entering: subtotals must equal the sum of their components within rounding tolerance. For example, in table 1, Civil persons + Group of civil persons + Juridical persons = Total; in table 7, Male + Female = Total; in table 13, Cattle + Buffaloes + Other bovine animals = Large ruminants. Where the source reports both an aggregate and components and they do not reconcile, enter the aggregate as published and flag the discrepancy.
5. **Enter the numeric value** in the correct cell. Use raw numbers, not thousands or millions; preserve the precision published by the NSO (do not round further). Use a period as the decimal separator. Leave cells blank only when the data are genuinely unavailable; never enter zero to mean "not reported".
6. **Use the prescribed missing-value codes** in the cell when a figure cannot be supplied:
 - .. = not available (NSO did not publish the figure)

- ... = not applicable (the category does not exist in this country, e.g. buffaloes in a country with no buffalo population)
- 0 = a true reported zero
- * = provisional figure
- c = confidential / suppressed for disclosure control

7. **Record the source for every populated cell** in the Notes column (see next section). No figure is acceptable without a source reference.

Sourcing and traceability requirements

Add a **Notes** column immediately to the right of each sub-table block (column F for the left block, column L for the right block). For every row populated, record:

Source: [Publication title], [Table or page reference], [URL], [Date accessed]

Examples:

- Source: Recensement Général de l'Agriculture 2021 — Rapport principal, Tableau 4.2, p. 87, https://nso.example.gov/rga2021_rapport.pdf, accessed 2026-05-06
- Source: NSO online database, Table AG-12 (Holdings by size class), <https://data.nso.example.gov/agcensus/AG-12>, accessed 2026-05-06

Where one row's figure comes from a different source than the rest of the table (common for irrigation or livestock breakdowns published as separate datasets), give the row-specific source on that row.

For derived figures — meaning a value you computed because the NSO published only the components or only the aggregate — flag it as Derived and show the calculation: Derived: 12,450 (cattle) + 3,200 (buffaloes) + 80 (other bovines). Source: Tableau 5.1.

Quality checks to perform before delivering

Before finalising the workbook, run these checks and report the result:

1. **Coverage check:** list any of the 26 sub-tables you could not populate, with the reason (data not collected, not published, published only at sub-national level, etc.).

2. **Internal consistency check:** confirm each sub-table's totals reconcile with its components, or flag the discrepancy.
 3. **Cross-table consistency check:** the total number of holdings should be approximately equal across tables 1, 2, 3, 4, and 5; total area should reconcile across tables 1, 2, 3, 4, and 5; total holdings with livestock in table 12 should equal the row Total holdings with livestock in table 13.
 4. **Universe check:** confirm that sub-tables 6–10 use the household-sector universe and not the all-holdings universe.
 5. **Reference period check:** confirm all figures relate to the same census reference year/day; flag any row drawn from a different round or update.
 6. **Definition deviations:** list every WCA concept that the national census defines differently, and explain how you handled the mismatch.
-

Output deliverables

Return three items:

1. **The completed Excel file**, preserving the template's structure, layout, fonts, merged cells, and column widths exactly. Do not insert or delete rows or columns inside the template area; the Notes column is the only addition permitted.
 2. **A short metadata block** at the top of the sheet (insert above row 1, or in a new sheet titled Metadata) listing: country, census reference year, census reference day, statistical unit, lower size threshold for inclusion in the census frame, holding population in the frame, household-sector population, full citations of all source documents, and date of compilation.
 3. **A compilation memo** (in chat, not in the workbook) summarising: which sub-tables were fully populated, which were partial, which were empty and why, all definitional deviations from WCA 2020, and any reconciliation issues you flagged.
-

What to do when you are unsure

- If the source documents are ambiguous about a definition, scope, or unit, **state your interpretation explicitly in the Notes** and proceed; do not guess silently.

- If a figure could plausibly be drawn from two different tables in the source with different values, **enter the figure from the most authoritative or most recent table** and record the alternative in the Notes.
- If you cannot map a national category to any TMR row without distorting it, **leave the row blank**, populate only what maps cleanly, and explain in the memo. Do not redistribute or pro-rate.
- Never fabricate, infer from regional patterns, or import figures from neighbouring countries to fill gaps. Missing is acceptable; invented is not.

Inputs I will provide with this prompt

- The blank template: TMR_Template_WCA2020_11082021.xlsx
- Source documents: {LIST_OF_PDF_AND_EXCEL_FILES}
- URLs of online census tables: {LIST_OF_URLS}
- Country: {COUNTRY_NAME}
- Census reference year: {YEAR}
- Any country-specific guidance from the FAO WCA country focal point: {OPTIONAL_NOTES}

Begin by confirming you have access to all listed sources, then proceed sub-table by sub-table in the order they appear in the template.
